

Claude Workshop

Prerequisite -

- A. Attendees will have Claude code desktop version downloaded in their environment.
- B. Python 3.11+ is installed.
Can check python version by running Mac - "python3 --version" and in PC "python --version"

Setup -

- A. In your terminal, run "pip install dremio-cli" for windows for mac run "pip3 install dremio-cli"
- B. Open Claude Code
- C. Go to <https://www.dremio.com/get-started/> and put in your e-mail address and then check your e-mail. You will see the link to get started with Dremio Cloud. - it takes a little under 3 minutes to set up.

Test

- A. Go to Dremio Cloud and show a quick walkthrough of the features.
- B. Now type in Claude Code "help me connect the Dremio Cloud account" - I will also show them where their PAT is located.
- C. Claude should tell them to run the following in their terminal "dremio profile create default --type cloud --base-url https://api.dremio.cloud --project-id (project ID Here) --auth-type pat --token YOUR_PAT_HERE"
- D.
- E. "Run a test query against Dremio to confirm my connection is working - it should run Select 1 as hello_dremio and return a result"

Main - create tables and views.

- A. Create Folders - Tell Claude the following: "Create a space called StrategicMaterialsDB with Bronze, Silver, Gold folders."
- B. Create Tables and Load Data - Next tell Claude "I have three CSV files in my workshop folder — mineral_sources.csv, geopolitical_risk_index.csv, and supplier_audit_findings.csv. Create Iceberg tables for each in the Bronze folder and load all the data."
- C. Create Silver Views - "Create a Silver view called ShipmentRisk that joins mineral sources to the risk index and calculates weighted risk exposure for each shipment"
- D. Create a view in StrategicMaterialsDB.silver called supplier_audit_mineral_sources that combines data from the table SupplierAuditFindings and MineralSources
- E. Create Gold Views - "Create a Gold view called VulnerabilityDashboard that shows each mineral type's total volume, average risk score, high-risk volume, and percentage dependence on high-risk countries"

- F. Use Dremio to create Wiki information for the ShipmentRisk, VulnerabilityDashboard and supplier_audit_mineral_sources. Views.

Ask Business Questions

"Which minerals are most exposed to geopolitical risk? Give me a business summary."

"Which suppliers should we be most worried about and why?"

"If China restricted exports tomorrow, what percentage of our Neodymium supply would be at risk?"

Lineage -

"Show me the lineage for the Gold VulnerabilityDashboard view, what are all its upstream dependencies?"

Reflections -

- A. Show Customer 360 data set - Now lets look at the customer 360 data set that is the sample data set that comes pre-configured on Dremio Cloud. - 177Million orders and 4.8 million customers
- B. Join data without the reflection - "s"
- C. Create a Reflection - "Create an aggregation reflection on the Customer360 orders table to pre-materialize it."
- D. Check if the reflection is built "Check the status of the reflection, is it ready yet?"
- E. Run query with the reflection "Run the same membership tier query again and time it."
- F. Ask - "Why was the second query so much faster? What did Dremio do differently?"
- G. Explain Autonomous reflections -
